## ALIGNMENTS

```
(AAMY9581-86) are a new class of mammalian proceins that are inhibitors of apoptosis (IAP) and which are characterised by the presence of a ring zinc finger domain (see also AAM19581) and at least one BIR (baculovirus IIAP repeat) domain (see also AAM19588). The HIAP amino acid sequences were deduced from cDNA clones (AAT7083) and AAT70838) from a human liver library. TAP polypeptides can be expressed in host cells (in vitro or in vivo) and used in methods for treating diseases and disorders involving apoptosis, esp. in a human diagnosed as HIV-positive or as having AIDS, a neurodegenerative disease, a myelodysplastic syndrome or an ischaemic injury, seleted from myocardai infarction, stroke, reperfusion injury, or a toxin-induced liver disease.

Inducing or NAIP po

Disclosure; Fig 3; 147pp; English.

Inducing apoptosis in proliferative mammalian cells with inhibitor of IAP or NAIP polypeptide - also methods for prognosis based on presence of IAP and NAIP, specifically applied to cancers involving p53 mutations.

This sequence is the human HIAP-2 protein, which is a inhibitor of apoptosis protein (IAP), and can be used in the method of the invention. The method is for enhancing apoptosis in cells from a mammal with proliferative disease by treatment with a compound that inhibits biological activity of an IAP or NAIP polypeptide. The inhibitory compounds are used to treat proliferative diseases, specially cancers of ovary, breast, pancreas, lymph nodes, skin, blood, lung, brain, kidney, liver nasopharnyx, thyrold, central nervous system, prostate, colon, rectum, cervix or endometrium, particularly to increase their sensitivity

```
or NAIP
                                                                        antisense
to chemotherapeutic agents. High levels of the IAP or NAIP proteins are detected in many cancers and are associated with poor prognosis, resistance to chemotherapeutic agents and mutations in p53 (it is suggested that wild-type p53 suppresses transcription of the IAP or NAIF genes). Transgenic animals are used for testing the effects of antisense oligonucleotides and for screening for the inhibitors
                                                                                                                                                                                                                         1 HAARMRIFMYWPSSVPVQPEQLASAGFYYVGRNDDVKCFGCDGGLRCWESGDDPWVEHAK

enhancing

Novel antisense inhibitor of apoptosis nucleic acid useful for en apoptosis in a cell, for treating cancer and other proliferative

Disclosure; Fig 3; 135pp; English. diseases.

οŧ The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAP1 or HIAP2. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method enhancing apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptosic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer.

Polypeptide capable of forming a complex with a polypeptide comprising a baculovirus inhibitor of apoptosis repeat domain useful for treating cancer and other neoplasms

Disclosure, Fig 1A; 53pp; English.

This invention relates to a substantially pure polypeptide having a length of less than 100 amino acids and capable of forming a complex with a polypeptide that includes a baculovirus inhibitor of apoptosis repeat (BIR) domain. The apoptosis pathway is known to play a critical role in embryonic development, viral pathogenesis, cancer, autoimmune disorders 

Human inhibitor of apoptosis 1 (hIAP-1) (AAW04583) is a protein useful for treating degenerative diseases, rheumatoid arthritis, septic shock,

```
been implicated in the development of cancer, autoimmune disorders (for example systemic lupus erythematosis and multiple sclerosis) and viral confections (including herpes virus, poxvirus and adenovirus. The inflictions of apoptosis (IAPS) are a family of proteins possessing one or ciractions including herpes virus, poxvirus and adenovirus. The inhibitors of apoptosis (IAPS) are a family of proteins possessing one or ciracian and HIAP2 (IAP1) all posses three BIR domains and carboxy terminal RING zinc fingers. The IAPS bind and inhibit caspases -3, -7 and -9 which are proteases involved in the initiation of apoptosis. Compounds which inhibit the activity of IAPS may therefore have cytostatic activity through the enhancement of apoptosis. The polypeptides of the invention are candidate peptide ligands for binding to the BIR domain of IAPs. They may be useful for the treatment of cancer and other neoplasms, such as leukamans, colon carcinoma, cervical cancer, uterine cancer, testicular cancer, small cell lung carcinoma, uterine cancer, testicular and wilm's tumour, and for enhancing apoptosis. The present sequence is that of the human inhibitor of apoptosis (IAP) protein HIAP2 BIR3 domain concerded and wilm's tumour, and for enhancing apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the protein sequence of inhibitor of apoptosis protein CIAPI. The invention provides a nucleic acid, such as an antisense oligomucleotide, which specifically Mybridises to a nucleic acid encoding an inhibitor of apoptosis protein, especially MIAPI, MIAPI, MIAPI, CIAPI, CIAPI and XIAP. A claimed method for inducing a cell's conditions permitting the cell with the nucleic acid under use of a vector, liposome, or a mechanical or electrical means. The method is used to treat acute lymphocytic leukaemia, acute myelogenous leukaemia, lung cancer, breast cancer, ovarian cancer, prostate cancer, lymphoma, Hodgkin's disease, malignant melanoma, neuroblastoma, renal cell carcinoma and squamous cell carcinoma (all claimed)
                                                                                                                                                                                                                                                   89 HAARMRIFMYWPSSVPVQPEQLASAGFYYVGRNDDVKCFCCDGGLRCWESGDDPWVEHAK 148
                                                                                                                                                                                                                                 60
as an antiviral defence mechanism, and for preventing cell death during strokes or trauma. Its amino acid sequence was deduced from a CDNA clone (AAT43709) that can be obtd. from human Jurkat cell lines or human osteoclastoma stromal cell lines. Recombinant hIAP-1 can be produced in prokaryotic or eukaryotic host cells, or expressed in vivo. It can also be used to screen for modulators of hIAP-1 activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding an inhibitor-of-apoptosis protein, useful for treating cancer, neurodegenerative disorder or cardiomyopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibitor of apoptosis; CIAP1; apoptosis; cancer; leukaemia; lymphoma; neuroblastoma; carcinoma; melanoma; cytostatic; gene therapy.

Mammalian IAP homologue B (MIHB) (AAW19746) is a human homologue of baculovirus inhibitor of apoptosis protein (IAP). Its amino acid sequence was deduced from a cDNA clone (see also AAT72711) isolated from a human foetal liver cDNA library using primers based on human EST sequences that resembled the BIR repeats of Crygia pseudotsuguta polyhedrosis virus IAP. IAP homologues (see also AAW19745 and AAW19747-25) and their derivatives and chemical analogues can be used in methods for modulating apoptosis in animal cells, specifically for treatment, by inhibition, of degenerative and infectious disease or, by promotion, of cancer and autoimmune disease

                                                The human cellular inhibitor of apoptosis proteins (c-IAPI/2 - AAT61590/T61591) comprise a series of defined structural domain repeats and/or a RING finger domain, in particular, at least two of a first domain repeat (AAM1354) or ascond domain repeat (AAM1354) or AAM13550, and a third domain repeat (AAM13551 or AAM13552) and/or a RING finger domain (AAM13553 or AAW13554), or a consensus sequences derived from these human genes. The nucleic acid is used for recombinant prodn. The human cellular inhibitor of apoptosis protein which modulates apoptosis regulation. The nucleic acids are useful in therapies where increased cell-specific apoptosis at desired, e.g. in restinosis, increased.

The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Cellular Inhibitor of Apoptosis-1 (c-IAP-1). The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of c-IAP-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research and in kits. The present sequence members of a biological pathway) of apoptosis-1

                                                                                                                                                                                                                                                                                                                                                                                                                                        appoposis protein XIAP. The invention provides a nucleic acid, such as an appoposis protein XIAP. The invention provides a nucleic acid, such as an antisense oligonucleotide, which specifically hybridises to a nucleic acid encoding an inhibitor of apportein, especially MIAPP, MIAP2, and encoding an inhibitor of apportein, especially MIAPP, Clay, CIAP1, CIAP2 and XIAP. A claimed method for inducing a cell's death comprises contacting the cell with the nucleic acid under conditions permitting the nucleic acid to enter the cell, especially the use of a vector, liposome, or a mechanical or electrical means. The method is used to treat acute lymphocytic leukaemia, acute myelogenous leukaemia, lung cancer, breast cancer, ovarian cancer, prostate cancer, lymphoma, Hodgkin's disease, malignant melanoma, neuroblastoma, renal calcinoma and squamous cell carcinoma (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           269 HAARMETFMYWPSSVPVQPEQLASAGFYYVGRNDDVKCFCCDGGLRCWESGDDPWVEHAK 328

The invention relates to a novel isolated protein complex comprising a RING-SH 3 polypeptide and a polypeptide selected from a Gag protein, a Gag late domain, PI3K, actin, myosin, Hsp60, Hsp90, STRM12, STRM2A, STRMM2B, WIS-UIM, a GTPASE, an EZ enzyme, tsg101, a cullin, RING-SH, and a clathrin. The novel protein complex has virucide activity and can be used to treat disorders as part of a vaccine. The protein complex and composition are useful for detecting cells infected with a virus, for identifying agents having antiviral activity, and for treating viral disorders caused by retroviruses, rhabdoviruses, or filoviruses. This sequence is a protein comprising the RING-SH complex of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        269 HAARNKIFMYWPSSVPVQPEQLASAGFYYVGRNDDVKCFCCDGGLRCWESGDDPWVEHAK 328

New purified lymphotoxin-beta receptor protein complex, useful for identifying modulators of lymphotoxin-beta receptor activity or expression for treating or preventing cancer or an autoimmune disorder, vasculitis or diabetes.

Disclosure; Page 7; Opp; English.

The present invention relates to a purified complex comprising a lymphotoxin beta receptor (ITbetaR) polypeptide and Smac polypeptide. The Numbhotoxin beta receptor (ITbetaR) complex is useful for identifying modulators of ITbetaR activity or expression for treating or preventing cancer or an immune disorder such as autoimmune disorder, e.g. rheumatoid arthritis, systemic lupus erythematosus, Goodpasture's syndrome, Grave's disease, Hashimoto's thyroditis, pemphigus vulgaris, myasthenia gravis, purpura, polymyositis, dermatomyositis, pernicious anaemia, Sjogren's syndrome, ankylosing spondylitis, vasculitis, or type I diabetes mellitus. The present sequence is an IAPI protein, which forms part of the complex of the invention

New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.

Disclosure; SEQ ID NO 200; 157pp; English.

The invention relates to a binding domain-immunoglobulin fusion protein comparising a binding domain polypeptide that is fused to an immunoglobulin heavy chain comparison polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide that is fused to the full a constant region polypeptide. The hinge region polypeptide comprises: a wild-type human iggl immunoglobulin hinge region polypeptide derived from (a) having 30 more cysteine residue; where the mutated human iggl immunoglobulin hinge region polypeptide derived from (a) having 30 more cysteine residues; where the first cysteine is not mutated; when it mannoglobulin hinge region polypeptide comprises; a wild-type human iggl immunoglobulin hinge region polypeptide comprises; where the mutated human iggl immunoglobulin hinge region polypeptide contains or cysteine residue; where the first cysteine is not mutated; when it is a mannoglobulin hinge region polypeptide contains or cysteine residue; and a mutated human iggl immunoglobulin hinge region polypeptide contains or cysteine residues. The hinding domain-immunoglobulin hinge region polypeptide contains or cysteine residues. The hinding domain-immunoglobulin hinge region polypeptide contains or pysteine residues. The hinding domain-immunoglobulin hinge region polypeptide contains or cysteine residues. The hinding domain-immunoglobulin hinge region polypeptide contains or suppersed to elimunoglobulin fusion protein, a recombinant expression changes and included are an isolated polymucleotide complication or a promoter, construct, producing the binding domain-immunoglobulin fusion protein, a recombinant expression or pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a recombinant condition or a g-cell composition comprising the binding domain-immunoglobulin fusion protein or pharmaceutical composition comprising the binding domain-immunogl

```

The invention relates to 242 human STAT6-activating proteins and cDNAs encoding them (ADG10411-ADG10894) and to sequences with 95% or more homology to the STAT6-activating proteins and their encoding nucleic acids. The invention also relates to recombinant vectors and host cells comprising a STAT6-activating protein-encoding nucleic acid; the recombinant production of a STAT6-activating protein; an antibody specific for a STAT6-activating protein; antisense oligonucleotides and ribozymes targeted to nucleic acids encoding a STAT6-activating protein; antisense oligonucleotides and ribozymes targeted to nucleic acids encoding a STAT6-activating enchods of screening for activators or inhibitors of STAT6-activating nucleic acids encoding them, and modulators of their activity or expression are useful in the diagnosis and treatment of allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, cancer, infections (e.g., HIV) cancer and disorders associated with Thi hyperfunction. The present sequence is related to the invention. proteins; drug compositions comprising a modulator of STAT6-activating protein activity or expression; and methods of treating patients by administration of the drug compositions. The STAT6-activating proteins,

Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and autoimmune disease; arthritide; gene expression analysis; rheumatic; antiarthritis; collagen-induced; immunosuppressive; antiarheumatic; antiarthritic; osteopathic; antigout; antinflammatory; dermatological; immunomodulatory; lupus; ankylosing spondylitis; Fibrositis; fibromyadja; osteoarthritis; gout; juvenile rheumatoid arthritis; Human baculoviral IAP repeat-containing protein 2, cIAP1, hiap-2. (CHIL-) CHILDREN'S HOSPITAL MEDICAL CENT. 31-OCT-2001; 2001US-0336220P 31-OCT-2002; 2002WO-US035433 Thorton SL; WPI; 2003-712740/67. GENBANK; NP 001157. WO2003072827-A1. immune; human Homo sapiens. 04-SEP-2003 Hirsch R, 

patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that that results in a gene expression signature of the mRNA, and using that that results in a gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of further comprises: a treatment of rheumatoid arthritis; identification of cher than a mouse; diagnosis of rheumatoid arthritis; in a mammal other than a mouse; diagnosis of rheumatoid arthritis; in a mammal of array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of a utoimmune disease or rheumatoid arthritis; streening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis, and reducing the symptoms are useful for methods and compositions of the present invention are useful for catigoria, antidosing and treating autoimmune disease caused by an infectious agent. This sequence represents a rhematoid arthritis, lupus, ankylosing spondylitis, fibrositis, or immune diseases caused by an infectious agent. This sequence represents a mour he specification. It has been supplied in an electronic format from The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a Disclosure; Page; 56pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            223,

US-09-069-023-29
i Sequence 29, Application US/09069023A
j Patent No. 6348573
i GENERAL INFORMATION:
APPLICANT: Nunez, Gabriel
j APPLICANT: Nonez, Gabriel
j APPLICANT: Roseki, Takeyoshi
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR IDENTIFYING APOPTOSIS
TITLE OF INVENTION: SIGNALING PATHWAY INHIBITORS AND ACTIVATORS
FILE REFERENCE: UM-03333
CURRENT APPLICATION NUMBER: US/09/069,023A
CURRENT FILING DATE: 1998-04-27
NUMBER OF SEQ ID NOS: 38
j SOFTWARE: Patentin Ver. 2.0
j SEQ ID NO 29
LENGTH: 618
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 HAARMRITEMYWPSSVPVQPEQLASAGFYYVGRNDDVKCFGCDGGLRCWESGDDPWVEHAK 60

Struct. Biol. 6:648-651(1999).

-!- FUNCTION: Apoptotic suppressor. The BIR motifs region interacts with TNF receptor associated factors 1 and 2 (TRAFI and TRAF2) to with TNF receptor receptor, which is then recruited to the tumor form an heteromeric complex, which is then recruited to the tumor necrosis factor receptor 2 (TNFR2).

-!- SUBUNIT: Interacts with SNAC and with PRSS25; these interactions inhibit apoptotic suppressor activity.

-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).

-!- TISSUE SPECIFICITY: Present in many fetal and adult tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Liston P., Roy N., Tamai K., Lefebvre C., Baird S., Cherton-Horvat G., Farahani R., McLean M., Ikeda J., Mackenzie A., Korneluk R.G.; "Suppression of apoptosis in mammalian cells by NAIP and a related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TISSUE-Fetal liver;

T and 2 genes.";

Genomics 46:495-503(1997).

Genomics 46:495-503(1997).

-!- FUNCTION: Apoptotic suppressor. The BIR motifs region interacts with TNF receptor associated factors 1 and 2 (FRAF1 and TRAF2) to form an heteromeric complex, which is then recruited to the tumor corrections factor receptor 2 (TNFR2).

-!- SUBGINIT: Interacts with SMAC and with PRSS25; these interactions inhibit apoptotic suppressor activity (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).

-!- TISSUE SPECIFCITY: Expressed in heart, brain, spleen, lung, consistent of the LAP family.

-!- SIMILARITY: Contains 3 BIR repeats.

-!- SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Found in both cortical and medullary cells of the thymus. Expressed at relatively high levels also in spleen, bursa, intestine and lung and at very low levels in testis, brain and skeletal muscle.
-: INDUCTION: High levels are induced within 4-8 hours of T-cell activation in spleen and thymus.
-: DOMAIN: The ring finger is important for its antiapoptotic effect.
-: SIMILARITY: Belongs to the IAPP family.
-: SIMILARITY: Contains 1 RARD domain.
-: SIMILARITY: Contains 1 RING-type zinc finger.
